

SamRajpoot - GenAI/LLM Portfolio Summary

Profile Focus (GenAI/AI View)

SamRajpoot's GitHub profile shows a strong applied AI + full-stack engineering direction. While the account includes broader web/mobile projects, the most relevant repositories demonstrate practical ML product development: model integration, inference APIs, data pipelines, and deployable user-facing interfaces.

Most Relevant GenAI / AI-Adjacent Repositories

1) *Python-Leaf-Detection-*

****GitHub Link:**** <https://github.com/SamRajpoot/Python-Leaf-Detection->

****Why it matters:**** Strongest GenAI/LLM-aligned project.

****What it does:****

An AI-powered plant disease detection system using Llama Vision via Groq API with FastAPI + Streamlit. It performs image-based disease analysis, outputs severity/confidence, and provides treatment guidance. This project reflects real-world multimodal AI integration and production-style API design.

2) *IntelliTrain-Mern*

****GitHub Link:**** <https://github.com/SamRajpoot/IntelliTrain-Mern>

****Why it matters:**** Best product-style AI platform project.

****What it does:****

A no-code style ML platform for training and deploying custom models (image/audio/pose workflows), combining frontend UX with backend ML services. Repository structure shows full-stack architecture plus audio-model handling, model training/inference endpoints, and data persistence, making it a strong AI system + product showcase.

3) *Freight-Rate-Prediction*

****GitHub Link:**** <https://github.com/SamRajpoot/Freight-Rate-Prediction>

****Why it matters:**** High-quality AI-adjacent predictive modeling work.

****What it does:****

An end-to-end forecasting pipeline using XGBoost, feature engineering, time-based validation, and scorer-based output validation. This highlights strong applied ML fundamentals: data quality handling, model evaluation discipline, and reproducible prediction workflow.

Overall Assessment of the Profile

Strengths

- Applied AI execution: Projects are implementation-focused and deployment-aware.
- Full-stack + AI integration: Ability to connect models with APIs/UI, not just notebooks.
- Practical ML workflow: Evidence of preprocessing, validation, and metrics-driven iteration.
- Product mindset: Repositories frame AI for real user value (agriculture, no-code model usage, forecasting).

Recurring Themes

- AI-assisted decision tools for domain use-cases.
- End-to-end builds (data/model/backend/frontend).
- Alignment with AI product engineering, ML-enabled web apps, and applied GenAI prototypes.

Best Portfolio Projects (Recommended Order)

1. Python-Leaf-Detection- (best GenAI/LLM signal)
2. IntelliTrain-Mern (best end-to-end AI product platform)
3. Freight-Rate-Prediction (best classical ML rigor)

One-Line Portfolio Positioning

"Software engineer focused on building real-world AI products by combining GenAI and multimodal model integration with full-stack delivery, deployment-ready APIs, and practical ML pipelines."
